

Resource Pack 1 - Context & Product Ecosystem

PBM 1 | Product-Aligned Learning Assistance for Funobotz

RELEASE WINDOW: MORNING | PARTICIPANT RESOURCE PACK 1

Purpose of this release

This pack provides only the Funobotz context needed to begin the challenge. It does not provide a system architecture, workflow, decision logic or technical solution path. Teams must create those independently.

About Funobotz

Funobotz is a hands-on learning platform built around paper robotics. Its learning approach combines folding, building, experimenting and creating so that learners encounter STEM and robotics through physical making before progressing toward more advanced technology ideas.

- Origami as a foundation: paper structure is used to connect form, function and engineering thinking.
- Hands-on learning: learners build and experiment rather than only read or watch.
- Progressive learning: current experiences include basic circuits, motors, lights and mechanisms, with the wider platform introducing ideas behind smart technology in age-appropriate stages.
- Story-driven context: products and characters exist inside the Funobotz Discovery World rather than as isolated technical exercises.

Discovery World 2026-27

Theme	Funobotz context
Adventure Quest	A story world containing locations such as the Grand Gateway, Hidden Forest, Rainbow Bridge, Castle Place, Mystery Cave, Fairy Garden and Dragon Valley.
Creator Planet	A village-style world containing places such as a tollgate, river bridge, school, library, water tower, market, hospital and fire station.
Roboverse Academy	A learning environment containing locations such as a smart entrance gate, welcome center, knowledge center, coding & AI hub, innovation tower and testing arena.

Funobotz Store context

The Funobotz Store is the customer-facing product environment. It includes customer account functions such as Sign In, My Profile, My Orders and My Addresses, along with a growing product catalogue. The final hackathon solution is expected to be suitable for this ecosystem.

Initial public product references

Product	Public positioning	Age / level
Petalo	Non-programmable, light-up discovery character using challenge-based learning around light and real-world situations.	7+ Beginner

Product	Public positioning	Age / level
Quacky - A Duck Bot	Non-programmable moving duck robot using a BO motor and a simple electrical circuit.	6+ Beginner
Tolly	Non-programmable character using a timer circuit and LEDs to demonstrate timed light sequencing.	7+ Beginner
Tiko - A Scorpio Bot	Non-programmable robot using a motor and thread-based movement to demonstrate motion and simple circuits.	6+ Beginner

Phase 1 participant responsibility

- Define and justify your own system architecture.
- Define your own design logic, data organisation and interaction approach.
- Create an initial proof of concept using self-created dummy data if required.
- Prepare for later Funobotz data releases without assuming that current dummy content represents the final structure.

No preferred architecture or workflow exists in this pack. Evaluation rewards the quality of the architecture and logic created by the team, not similarity to a reference design.

Public Funobotz facts in this pack are based on store.funobotz.com, accessed 2 October 2026. Organizer-supplied material is authoritative if later releases differ.
